

The Fast Intuitive Search

for your SAP® Applications

- + Fast search results integrated in the SAP® application
- + Simple installation via "Ready to Run" scenarios
- + Search can be performed for all fields (for example, independently of first and last name)
- + High level of user-friendliness through fault tolerance
- + Increase in employee productivity, for example, in material search
- + Increase in customer satisfaction, e.g. in Webshop
- + Independent of language used
- + Typing errors: "Modlue" instead of "Module"
- + Phonetic errors: "Sabwoofer" instead of "Subwoofer"
- + Spelling mistakes: "Melissa Everidge" instead of "Melissa Etheridge"
- + Word transpositions: "Screw with counter sink" instead of "Counter sunk screw"
- + Synonyms or a thesaurus: "Neon lamp" instead of "Fluorescent lamp" can be entered
- + Search can consolidate data for all tables
- + Search via long texts possible

SAP® Certified
Integration

Fast and Intuitive Search

Every year, the master data in your SAP® system is searched thousands of times and each search costs time, even if the results do not contain the desired content. The time-consuming search and the results that do not meet users' expectations lead to errors. These errors can be, for example, duplicated master data, incorrect reports or a loss of knowledge, as a repair operation could not be found in a Service message. The Marble FACT-Finder provides a noticeable improvement in speed and function, in comparison with the standard search in your SAP® application.

Using the Marble FACT-Finder, data is searched in seconds and on a fault-tolerant basis. Users can choose between an exact field search and a string search. The contents of a material long text or the long text of a Service message can also be searched.

The result is shown in a list with a percentage match value. Marble FACT-Finder works on a fault-tolerant and language-independent basis.

The result can be influenced by various user exits. Lines can be deleted or highlighted in colour. Additional information, such as sales or purchase order quantity, can also be read into the results display.

Technical Aspects

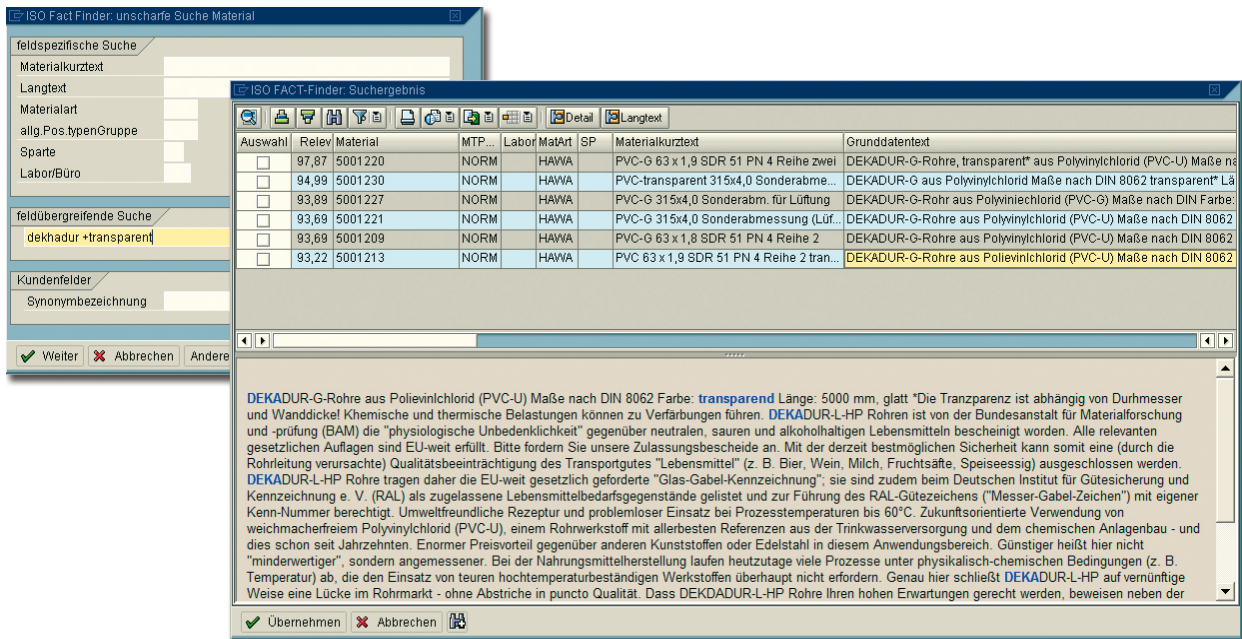

The cutting edge technology of our partner OMIKRON Data Quality is integrated in Marble FACT-Finder. The search can be used for all languages that can be represented by an alphabet (such as Russian, Hungarian, Arabic). Marble FACT-Finder is installed in your SAP® system via an SAP® transport.

In the standard system, the search is available for the respective object, such as in the F4 search in the material master. The search help can also be integrated in custom-developed transactions or called up from a portal or an external application via an RFC-capable function module.

Marble FACT-Finder does not require any of the resources of your R/3® system. It runs on a Linux or Windows server and is installed easily (in less than one day). Marble FACT-Finder has been implemented in its own worldwide unique SAP® namespace.

Application Scenarios (Add-On)

Ready-made "Ready to Run" application scenarios are available to optimise your business processes via a high-performant and intelligent search. The search is performed as a cross-field search or an exact field search. If long texts are available, the contents of these can also be searched. Changes to the master data are transferred synchronously to Marble Fact-Finder. The object can thus be searched for immediately after the master data has been created.

Material Master Scenario

Search is performed via the material description and the material long text.

Customer/Vendor Scenario

Search is performed via the address fields with additional information in the result such as deletion indicator, or whether a company code view is maintained.

CRM Scenario

Search is performed via the business partner master data; the search is integrated in the SAP Locator.

Relationship Type Scenario

Search is performed for business partner master data with relationships. When Search field 1 is entered, there is a reference to Search field 2 if the contact person for an organisation is found.

Service Message Scenario

Search is performed via the message long text. A Service staff member can thus search the contents of an error message.

Equipment with Customer Scenario

Search is performed via the tables Equipment and Customer. The user can thus search for equipment with a reference to customer and city.

Purchase Order Document Scenario

Search is performed via the purchase order text and vendor.

Sales Document Scenario

Search is performed via the purchase order text and sold-to party.

Enhancements

Customer-specific searches can be integrated in Marble FACT-Finder. Each SAP® table is available here for individual searches or linked in the case of dependent table contents. The contents of various tables can thus be included in a search. Using Marble FACT-Finder, tables from NON-SAP® systems or tables from legacy systems are also available for a fault-tolerant search in the case of migration .
